

FiberTite® Storage Guidelines:

Recommended storage:

- The membrane should be stored horizontal with full protection and be kept off the roof deck away from ponding or flowing water.

Site storage:

- FiberTite must be stored dry. At the job site, it is important that the materials are stored on pallets (raised above the ground) and covered with light colored tarpaulin.
- Store membrane in its original plastic wrap with ends open in a cool, shaded area and cover with light colored breathable waterproof tarpaulin.
- FiberTite materials must be kept under cover, in order to avoid sudden changes in temperature and potential condensation.
- Plastic packaging is not intended as a protection from weather at the job site or during outside storage.
- Cover and protect materials at the end of each day's work with light colored breathable waterproof tarpaulin.
- Do not remove any protective tarpaulins until immediately before the material is installed. Extreme heat or cold conditions may require special storage.
